11th Annual Friends of Science Luncheon

Featuring Dr. Ross McKittrick
Professor of Economics, University of Guelph, ON

The “Pause” in Global Warming: Climate Policy Implications

Computer models of the climate system predicted that there should have been far more warming than was observed over the last 15 years, in response to rising atmospheric carbon dioxide levels. There is now increasing evidence that climate models have systematically exaggerated the actual effects of greenhouse gas emissions. This, in turn, has potentially major policy implications since model estimates of greenhouse gas effects drive estimates of the social costs of carbon and the perceived urgency of reducing emissions. This presentation will provide a non-technical overview of the growing divergence between climate models and reality, and explain why it will likely soon force a deep re-think of the basic assumptions on which global climate policy is based. Policy makers and stakeholders need to be aware of these developments to avoid making long term plans based on assumptions that look increasingly unlikely to be true.

DATE: May 13th, 2014
