## Purpose, approach, and motivation

- Meth8 is a theorem prover to account for alethic logic as the most conservative extension of classic logic
- The logic system adopted is bivalent multi-valued logic as a quaternary system based on the 2-tuple.
- The current need is to upgrade devices for situational awareness in real time scenarios for command and control.
- The problem is that many theorems implemented in modal logic parts are flawed, and hence decision making is degraded.
- This deficiency is overcome with a variant of the $Ł_{4}$ system that corrects these mistakes.

## Overview

- Theorem prover for modal logic : the 2-tuple
- Jan Łukasiewicz : $\mathrm{Ł}_{4}$
- Garry Goodwin : $Ł_{4}$ Variants
- Test results : "A as true does not imply necessarily A."

## Overview: modal logic theorem prover

- 2-tuple as 2-sides to map alternative quaternary, 4-valued logics:
- left bit is sinister false $\mathbf{0}$;
- right bit is dexter true 1
- Bivalent and decidable:
- not vector space;
- not undecidable
- Scalable and expandable
- 8-bit version has 256 connectives each as its own truth table for non quantified expressions.
- 16-bit version has 65,536 connectives each as its own truth table for quantified expressions.

## Overview: Jan Łukasiewicz

- Untenable $Ł_{4}$ :
- Béziau : $\diamond \mathrm{A} \& \Delta \mathrm{~B} \rightarrow \diamond(\mathrm{~A} \& \mathrm{~B})$

If possibly Booth killed Lincoln and possibly Booth never killed anyone, then it is possible that Booth both killed Lincoln and never killed anyone.

- Font, Hájek $\square \mathrm{A} \rightarrow(\diamond \mathrm{B} \rightarrow \square \mathrm{B})$

Necessarily every coin has two sides implies that if possibly the next flip of the coin lands heads, then necessarily the coin lands heads.

- Tenable $Ł_{4}$ : Łukasiewicz left a door open in two matrices M9 and M13 that prove the same system when kept apart, not combined.
- Prefix or Polish notation [+ 3 4] versus:
- Infix notation [(3)+(4)]
- Postfix or Reverse Polish notation (fewer parens) [34 +]

## Overview: Garry Goodwin semantic-qube.com.uk

- Multi-valued logic
- Cartesian graphing in N -dimensions
- Color mapping in RGB
- Quantified axiom mappings in the tesseract
- Modal logic in plausible variants of $Ł_{4}$ as matrix $Ł_{4 . \mathrm{M} 9}, Ł_{4 . \mathrm{M} 13}$
- 3 variants with 3 options
- With and without $R$ reference for worlds and frames
- Multi-valued Boolean logic leads to incompleteness
- "Some arguments which are never false fail to be theorems."
- Postfix notation: no ambiguity of $\diamond \square \mathrm{A}$ in i order as $\mathrm{A} \nabla^{\mathrm{ii}} \square^{\mathrm{i}}$

## Acronym

- Meth8: Mechanical Theorem in 8-bits
- Based on the 256-connectives of 8-bits:

Connective number below is 00110011 [conditional] 01010101.

- Distinct from 65536-connectives of 16-bits:

For proofs with existential $\exists$ and universal $\forall$ quantifiers
\& AND: 4369: 00010001 00010001: $00000000 \quad 00000000 . .1100110111101111$

- Demo Meth8 is free with literals scaled down.
- Two literals for propositions: $\mathrm{p}, \mathrm{q}$
- Two literals for theorems: A, B

## Meth8 logical expressions

- Antecedent and Consequent
- Literal type:

13 theorems: A, B, C, D, E, F, G, H, I, J, K, L, M
13 propositions: $\mathrm{n}, \mathrm{o}, \mathrm{p}, \mathrm{q}, \mathrm{r}, \mathrm{s}, \mathrm{t}, \mathrm{u}, \mathrm{v}, \mathrm{w}, \mathrm{x}, \mathrm{y}, \mathrm{z}$

- Modal operators: \# necessarily $\square ; \%$ possibly $\diamond ; \sim$ not $\neg$ 3 affirmed: [none], \#, \%
3 dis-affirmed: $\sim \quad, \sim \#, \sim \%$
- Conditional: AND \& ; OR + ; IMP > ; EQV =
- 4 affirmed: \&, +, >, =
- 4 dis-affirmed: $\sim \&, \sim+, \sim>, \sim=$

## Example: Meth8 data structure

LET antecedent $=13$
LET consequent $=13$
LET modifier $=6$
LET conditional $=8$
LET model $=3$
LET rows $=4$
DIM expr $\$(0,0,0,0,0,0,0)!2$-bits $* 4$ values $=1$ byte
MAT REDIM expr $\$(6,13,8,6,13,3,4)$ ! 7 -dimensions

## Example: Meth8 memory footprint

- Literal expressions: 13 theorems; 13 propositions
- Combination of antecedent, consequent, conditional

Antecedent ( 6 modifiers * 13 literals)

* Consequent ( 6 modifiers * 13 literals)
* Conditional ( 8 connectives) $=48,672$ expressions
- Combination of literal segments and number of modes
* 3 models $=146,016$ combinations
- Memory size (8-bits/row * 4 rows/table $=32$-bits $=4$-bytes)
* 4 -bytes per expression $=584,064$ bytes $\approx 571 \mathrm{~KB} \quad(<1 \mathrm{MB}$ part)

## Meth8 paren parsing : Sliding Window

1. Map $\mathrm{L} / \mathrm{R}$ parens
2. Slide window L
3. Tag first adjacent L/R pair [04, 09]; | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| 2. | $\ll$ | 01 | 02 | 04 |  |  |  |  | 09 |  |  | 12 |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 17 | 18 | $<$ |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  | L | L |  |  |  |  | R |  | L |  |  |  |  | R |
| R | R |  |  |  |  |  |  |  |  |  |  |  |  |  |  | then next [12,17]

4. Write stack list [04, 09], [12, 17]
5. Match remaining parens [02, 18]

|  |  |  | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 1. |  | $\square$ | $($ | $\square$ | $($ | 0 | A | $\rightarrow$ | B | $)$ | $\leftrightarrow$ | $\square$ | $($ | A | $\rightarrow$ | $\square$ | B | $)$ | $)$ | $\mathrm{S} 5: 58$ |
|  |  |  | L |  | L |  |  |  |  | R |  |  | L |  |  |  |  | R | R |  |
|  |  |  | 02 |  | 04 |  |  |  |  | 09 |  |  | 12 |  |  |  |  | 17 | 18 |  |

| 3. |  |  | $\mathbf{L}$ |  | $L$ |  |  |  |  | R |  |  | $\underline{\mathrm{L}}$ |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| R | R |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | $\mathbf{0 2}$ |  | 04 |  |  |  |  | 09 |  |  | $\underline{12}$ |  |  |  |

| $5 . \mathrm{L}$ |  |  | $\mathbf{0 2}$ |  | 04 |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Meth $N$ scalability

- Meth8 [2^3] uses 8-bit connectives (256) in truth tables of 32-bits (of 8-bits / row).
- Meth 16 [2^4] uses 16 -bit connectives $(65,536)$ in truth tables of 1024-bits (of 64-bits / row).

But do we need a logic with more than $\mathbf{6 5 , 5 3 6}$ connectives?
Maybe to map the human brain using the Method and system for Kanban cell neuron network, U.S. Patent (to issue 12/2015).

- Meth $N\left[2^{\wedge}(\log N / \log 2)\right]$ uses $N$-bit connectives $\left(2^{\wedge} N\right)$ in truth tables of $\left(2^{\wedge} N\right) / N$-bits (of $\left(2^{\wedge} N\right) / N / 4$-bits / row).

## What Meth $N$ is NOT

- Lattice logic of informational states as $\{$ T, F, TF, 0$\}$
- "The cat is on the mat." $\{T F\}$
- "Tabby the cat is on the mat outside." $\{\mathrm{T}\}$
- "Tabby and Kitty are on the mat inside." $\{\mathrm{F}\}$
- "Kitty is the name of a stuffed animal." $\{0\}$
- Paraconsistent logic ("beside the consistent")
- Bit-inconsistent truth tables
- Non-classical connectives or rules of inference
- Quantum logic (no law of distribution)
- Probabilistic logic (Bayesian analysis)

## Variants of $£_{4}$ : the Option Approach

- The 2 -tuple follows $Ł_{4}:\{00,10,01,11\}, 11$ as designated.
- For \{ Contradiction, False, True, Tautology \}: Boolean B ${ }_{4}$
- Variant 1: $\{\mathrm{F}, \mathrm{C}, \mathrm{N}, \mathrm{T}\}$ with designated value as T
- For \{ False, Contingent, Non-Contingent, True \}
- Variant 2: \{ U, I, P, E \} with designated value as E
- For \{ Un-Evaluated, Improper, Proper, Evaluated \}
- Option 1, 2, 3:
- Strategies disambiguate the middle rows of truth tables where two unary propositions fall within the scope of the same modal operator.

## Variants 1, 2a, 2b

| $\mathrm{B}_{4}$ | V1 | V1 | V1 [] | V1 | $\left.\begin{array}{l} V 1 \\ \sim \end{array}\right]$ | $\begin{aligned} & \text { V1 } \\ & \sim \infty \end{aligned}$ | $\mathrm{V}^{\mathrm{V} 2 \mathrm{a}}$ | V2a | $\begin{aligned} & \mathrm{V} 2 \mathrm{a} \\ & {[]} \end{aligned}$ | $\mathrm{V} 2 \mathrm{a}$ | $\begin{aligned} & \mathrm{V} 2 \mathrm{a} \\ & \sim[] \end{aligned}$ | $\mathrm{V} 2 \mathrm{a}$ | $\sim_{\sim}^{V}$ | 2 b | $\begin{aligned} & \text { V2b } \\ & \text { [] } \\ & \hline \end{aligned}$ | $\begin{aligned} & \mathrm{V} 2 \mathrm{~b} \\ & \infty \\ & \hline \end{aligned}$ | $\begin{aligned} & \mathrm{V} 2 \mathrm{~b} \\ & \sim[] \end{aligned}$ | V2b | $\mathrm{B}_{4}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 00 | $T$ | F | F | C | T | N | E | U | U | I | E | P | $E$ | U | U | P | E | 1 | 00 |
| 01 | $C$ | N | N | T | C | F | I | P | P | E | I | U | $P$ |  | I | E | P | U | 01 |
|  | $N$ | C | F | C | T | N | $P$ |  | U |  | E | P |  | P | U | P | E | I | 10 |
| 1 | $F$ | T | N | T | C | F | $U$ | E | P | E | I | U | $U$ | E | 1 | E | P | U | 11 |

The interpretation of truth tables is non standard: truth possibilities are (T, N, C) and (E, P, I); but proof is (T) and (E).

Truth possibilities are bivalent in V2a as 'is the case' or in V2b as 'is not the case'. Use of 'the case' disambiguates truth possibility from truth evaluations. Truth values are truth evaluations.

Middle rows in V2b 'not the case' contain a mix of the same values, making it unclear which matrix (V2a or V2b) to apply to the same modal operator. Hence these rows are not applicable.

## Variant 2 modal operations for mixed truth combinations

|  | $\square$ | 0 |
| :---: | :---: | :---: |
| Option 1 | x E | + U |
| Option 2 | x U | + E |
| Option 3 | x P, x I | + P, + I |

Options 1, 2, and 3 cover permutations of modal operators.
Option 1 is for "won't decide", leaving the rows of mixed truth combinations unchanged.
Option 2 is for "can't decide", applying to Variants 2a and 2b.
Option 3 applies Variants 2a and 2b separately and records the different results.

The user may invoke any or all options.

## Meta-variables $\{\mathrm{A}, \mathrm{B}\}$ of Variants 1 and 2

|  | Variant 1 |  | Variant 2 |  |  |
| ---: | :---: | :---: | :--- | :--- | :--- |
|  | $\diamond \mathbf{A}$ | $\square \mathbf{A}$ | $\diamond \mathbf{A}$ | $\square \mathbf{A}$ | $\diamond \mathbf{A A}$ |
| Top Row | $\mathrm{A}+\mathrm{M} 1$ | $\mathrm{~A}^{*} \mathrm{M} 1$ | $\mathrm{~A}+\mathrm{M} 2 \mathrm{a}$ | $\mathrm{A}^{*} \mathrm{M} 2 \mathrm{a}$ | $\mathrm{AA}+\mathrm{M} 2 \mathrm{a}$ |
| Middle Rows | $\mathrm{A}+\mathrm{M} 1$ | $\mathrm{~A}^{*} \mathrm{M} 1$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | AA |
| Bottom Row | $\mathrm{A}+\mathrm{M} 1$ | $\mathrm{~A}^{*} \mathrm{M} 1$ | $\mathrm{~A}+\mathrm{M} 2 \mathrm{~b}$ | $\mathrm{~A}^{*} \mathrm{M} 2 \mathrm{~b}$ | $\mathrm{AA}+\mathrm{M} 2 \mathrm{~b}$ |

Variant 1 shows every truth function for an expression in that form.
Variant 2 shows unary propositions that do not mix truth combinations.
The doubled meta-variable $\{\mathrm{AA}, \mathrm{BB}\}$ shows complex expressions of two or more propositions that mix truth possibilities.

For example, $\diamond$ AA may be $\diamond(\mathrm{p} \& \mathrm{q})$ or $\diamond(\mathrm{p} \& \square \mathrm{q})$.
When testing an expression we apply matrices by this table.

## Two examples disprove the implausible theorems of $\mathrm{Ł}_{4}$

$\diamond \mathrm{A} \& \diamond \mathrm{~B} \rightarrow \diamond(\mathrm{~A} \& \mathrm{~B})$
If possibly Booth killed Lincoln and possibly Booth never killed anyone, then it is possible that Booth both killed Lincoln and never killed anyone.
$\square \mathrm{A} \rightarrow(\diamond \mathrm{B} \rightarrow \square \mathrm{B})$
Necessarily every coin has two sides implies that if possibly the next flip of the coin lands heads, then necessarily the coin lands heads.

## Meta-data of all permutations in six models for $(\diamond \mathrm{A} \& \diamond \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \& B)$

Removing one model based solely on V2b which represents a model based solely on V2a reduces redundancy.

Models that also mix V2a and V2b are removed.
There are five V2 models and one V1 model for six models.
This becomes its own proof method, where each row is treated as its own model.

## Non redundant models for

## $(\diamond A \& \diamond B) \rightarrow \diamond(A \& B)$

This accounts for all truth tables in unique models.

Underlined consequents are un-evaluated results where the antecedent has an evaluation.

This means some models have the antecedent as un-evaluated where the consequent is true.

This disproves the $Ł_{4}$ theorem.

|  | ( $)$ A | $\boldsymbol{\mathcal { L }}$ | $\bigcirc$ B) | $\rightarrow$ | $\bigcirc$ | (A | $\boldsymbol{\&}$ | B) |

| 2.3 | $\mathrm{AA}_{2}$ |  | $\mathrm{BB}_{2}$ | $\mathrm{BB}_{2}$ |  |

There are five non redundant models of the generalized theorem.

# Non redundant models for $\square \mathrm{A} \rightarrow \diamond(\mathrm{B} \rightarrow \square \mathrm{B})$ 

This shows the $\succeq_{4}$ theorem is not a theorem in this variant.

It is also worth noting that

$$
\square \mathrm{A} \rightarrow(\mathrm{~B} \rightarrow \square \mathrm{~B})
$$

is also not a theorem.

## Some general test results

- Not general theorems

$$
-\quad \mathrm{S} 5 \vdash \square \mathrm{~A} \rightarrow \square \mathrm{~A}
$$

- Not validated, but the consequent is never false

$$
\begin{array}{ll}
- & \diamond(\mathrm{A} \& \mathrm{~B}) \rightarrow \diamond \mathrm{A} \& \diamond \mathrm{~B} \\
- & \square(\mathrm{A} \rightarrow \mathrm{~B}) \rightarrow(\square \mathrm{A} \rightarrow \square \mathrm{~B}) \\
- & \square \mathrm{A} \rightarrow(\diamond \mathrm{~B} \rightarrow \square \mathrm{~B}) \\
- & \square \mathrm{A} \rightarrow(\mathrm{~B} \rightarrow \square \mathrm{~B})
\end{array}
$$

- Limited validity
- Axiom K
- Axiom B: A $\rightarrow \square \diamond \mathrm{A}$
- Axiom 5: $\diamond \mathrm{A} \rightarrow \square \diamond \mathrm{A}$

## Not general theorems, and with semantic consequence

- K axiom $(\mathrm{A} \rightarrow \mathrm{B}) \rightarrow(\square \mathrm{A} \rightarrow \square \mathrm{B})$

$$
\begin{aligned}
& 08 \neg(\mathrm{~A} \& \mathrm{~B}) \leftrightarrow \square(\mathrm{A} \rightarrow \neg \mathrm{~B}) \\
& 15 \square(\mathrm{~A} \vee \mathrm{~B}) \rightarrow(\square \mathrm{A} \vee \diamond \mathrm{~B})
\end{aligned}
$$

- D axiom

$$
33(\diamond \neg A \vee \diamond \neg B) \vee \diamond(A \& B)
$$

- B axiom

$$
40 \neg(\diamond \square \diamond \mathrm{~A} \& \square \neg \mathrm{~A})
$$

- S5 axiom

$$
57 \square(\square \mathrm{~A} \rightarrow \square \mathrm{~B}) \mathrm{v} \square(\square \mathrm{~B} \rightarrow \square \mathrm{~A})
$$

## Not general theorems, but without semantic consequence

- K axiom

$$
\begin{aligned}
& 19(\square \mathrm{~A} \& \diamond \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \& \mathrm{~B}) \\
& 21(\square \mathrm{~A} \rightarrow \diamond \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \rightarrow \mathrm{~B})
\end{aligned}
$$

- S4 axiom
$42(\diamond \mathrm{~A} \& \square \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \& \square \mathrm{~B})$
- S5 axiom

$$
\begin{aligned}
& 54(\square \mathrm{~A} v \diamond \mathrm{~B}) \rightarrow \square(\mathrm{A} v \diamond \mathrm{~B}) \\
& 55(\diamond \mathrm{~A} \& \diamond \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \& \diamond \mathrm{~B}) \\
& 56(\diamond \mathrm{~A} \& \square \mathrm{~B}) \rightarrow \diamond(\mathrm{A} \& \square \mathrm{~B}), \text { also }(\mathrm{A} \& \square \mathrm{~B}) \rightarrow(\diamond \mathrm{A} \& \square \mathrm{~B})
\end{aligned}
$$
